The Smith Meter® Model 210 Valve is typically used in conjunction with either the Smith Meter® AccuLoad®, MiniLoad, or Model SS1 Controller and Preset Counter for preset loading control at load racks, bulk plants, or processing installations.

**Features**

- Simple control loop.
- Control loop isolation valves.
- Low pressure drop.
- Separate opening and closing speed control.
- Compound spring.
- Horizontal or vertical applications.
- Full range of optional control functions.

**Optional**

- 2" Reduced Port Valve – Ideal for renewable fuels blending.

**Operation**

The Smith Meter Model 210 Valve is a Smith Meter 200 Series Valve with two solenoid controls (see Figure 1). The normally-open (N.O.) and normally-closed (N.C.) solenoids, located in the upstream and downstream portions of the control loop, respectively, control the operation of the valve. With both solenoids energized, high upstream pressure is blocked allowing the product in the cover to vent to low downstream pressure, opening the main valve. Conversely, de-energizing both solenoids allows high upstream pressure to close the valve.

Energizing just the N.O. solenoids locks fluid in the valve cover, which locks the valve poppet in a fixed position, to maintain a constant flow rate as long as operating conditions do not change. When operating conditions (e.g., pressures) change, causing a change in flow rate for that fixed valve opening, the flow controller (e.g., SS1 or AccuLoad) signals the appropriate solenoid to open momentarily to readjust flow rate back to its set value.

When the set flow rate changes (e.g., from low flow start to high flow limit, or during multi-step valve shutdown), the appropriate solenoid is signalled to open until flow rate adjusts to the new set value. See Figure 2 for a typical truck loading flow rate sequence.

Located between each solenoid and the main valve port is a valve response control device, typically a ball valve.

---

**Figure 1 — Model 210 Valve Schematic**

**Figure 2 — Typical Load Cycle**
This device is used to fine tune the opening/closing rate of the valve, as well as providing total control loop isolation for ease of service. Adjustment of these devices controls the flow to the cover chamber, permitting adjustments based on product viscosities and pressures.

**Specifications**

**Maximum Viscosity**
Up to 200 SSU (40 mPa·s)
Above 200 SSU (40 mPa·s), consult factory.

**Pressure Rating/Connections**
Class 150 ASME, 285 psi (19.6 bar)
Class 300 ASME, 300 psi (20.7 bar)

**Temperature Range**

**Pressure Drop (When Valve is Not Flow-Limiting)**

![Pressure Drop Graph](image)

**Voltage (Solenoids)**
Standard: 110/120 Vac, 50/60 Hz.
Optional: 220/240 Vac, 50/60 Hz.
24 Vdc.
12 Vdc.
Other voltages, consult factory.

---

1 \( 1 \text{ mPa·s} = 1 \text{ cP} \)
2 Pressure ratings are based on temperatures of -20°F to 100°F (-28°C to 38°C). For operation at higher temperatures, the maximum working pressure may be derated.
3 PED requirements limit applications to liquids with maximum vapor pressures of .5 bar above atmospheric pressure, at maximum allowable temperature.
4 For temperature outside these ranges, consult factory.
